Career Bridge Portfolio Simulations

Complete Simulation Specification — Product Management V1

Nexus Bank Startup Account: Product Strategy Simulation

Document Status: Production Ready
Version: 1.0
Prepared by: Career Bridge Foundation
For: Internal use, developer briefing, and Notion upload
Not for external distribution

HOW TO USE THIS DOCUMENT

This is the single source of truth for building and running the Nexus Bank Product Management simulation. Every person involved in this project — founder, developers, coaches, and assessors — should refer to this document.

Founders and coaches: Read Sections 1 through 6 and Section 8.
Developers: Read every section. Sections 7 and 9 are your primary build reference.
Do not make changes to rubric criteria or JSON structures without notifying the founder first.

Section 1 — Simulation Metadata

Field	Detail
Title	Nexus Bank Startup Account: Product Strategy Simulation
Discipline	Product Management
Fictional Company	Nexus Bank
Industry	Financial Services / Banking
Company Size	Large established UK bank, 4,000+ employees, operating across UK and Europe
Candidate Role	Associate Product Manager (entry to mid level, 0 to 3 years experience)
Difficulty Level	Entry to Mid
Estimated Completion Time	60 to 90 minutes
Number of Prompts	3
Assessment Type	Mixed submission — typed responses and optional document or URL upload
Credential Issued	Career Bridge Verified: Product Strategy — Financial Services

---

Section 2 — Scenario Brief

> This is presented to the candidate at the start of the simulation, **below the scenario introduction video.** It is available throughout the simulation for reference.

It is early January. You have just joined Nexus Bank as an Associate Product Manager on a newly formed squad. The timing is not coincidental — in December, Nexus Bank ran a high-profile Christmas advertising campaign positioning itself as the go-to bank for ambitious startups. The response was overwhelming. Within two weeks, the customer service team logged over 1,400 inbound enquiries from founders, early-stage companies, and accelerator graduates asking about business transaction accounts.

The problem is simple and urgent: there is no product. There is interest, but no account that meaningfully serves startup needs. The CEO has now formally commissioned a cross-functional group to build one, and you are the Associate Product Manager responsible for shaping what it becomes. Your squad includes engineers, a UX designer, a compliance lead, and a data analyst. You have been given three months to deliver a product recommendation to the executive team.

You quickly discover that the internal team has no shared understanding of what startups actually need from a bank. Some stakeholders want to replicate a standard SME account with a lower fee. Others want to build deep integrations with accounting tools like Xero and QuickBooks. The Head of Commercial Banking insists that due diligence and compliance requirements cannot be relaxed. Meanwhile, two fintech competitors have launched dedicated startup accounts in the last six months and are gaining ground fast.

Your Challenge: Define the product strategy for this new startup account. Starting with research, you must identify what the market actually needs, how the competition is positioned, and what Nexus Bank can realistically build that will win. You have three prompts to work through. Each one tests a different part of your strategic thinking. Write clearly, think like a PM, and show your working.

Section 3 — Candidate Prompts

> Each prompt appears on its own screen. Candidates may not go back to a previous prompt once submitted. Progress is shown as Step X of 3 throughout.

Prompt 1 — Market Discovery

Before you can define what the Nexus Bank startup account will offer, you need to understand the market. Describe the research process you would use to identify what startups actually need from a business bank account. Who would you speak to, what questions would you ask, and how would you validate your findings before using them to shape the product? Be specific about your methods and explain how you would prioritise the insights you gather.

Submission Type: TYPED
Word guidance: 200 to 400 words
Word count display: Show live word count to candidate

Prompt 2 — Competitive Landscape

Two fintech competitors — Starling and Tide — launched dedicated startup accounts in the last six months and are gaining traction. Using what you know about the startup banking market, analyse the competitive landscape. What are these competitors offering, where are their gaps, and what could Nexus Bank uniquely offer that they cannot? How does your competitive analysis inform the product positioning for this new account?

Submission Type: EITHER
Option A — Typed: 200 to 400 words
Option B — Upload: Structured analysis document. PDF or Word. Max 10MB.
Candidate instruction for upload: You may submit a structured competitive analysis document instead of a typed response. Clearly label your document with your name and the prompt title before uploading.

Prompt 3 — Product Strategy Definition

Based on your market research and competitive analysis, define the product strategy for the Nexus Bank startup account. What are the two or three core features you would prioritise for the first release, and why? How would you handle the tension between what startups want and what Nexus Bank's compliance and commercial teams will accept? What does success look like at six months post-launch, and how would you measure it?

Submission Type: EITHER
Option A — Typed: 200 to 400 words
Option B — Upload or URL:
- Upload: Strategic summary document. PDF or Word. Max 10MB.
- URL: Built in Figma, Notion, Google Docs, Miro, or any publicly accessible tool. Link must be set to public before submitting.
- If submitting a URL, also complete the typed rationale field (100 to 200 words) explaining your strategic choices.

Candidate instruction for URL: Share a link to your strategy document or visual. Make sure the link is publicly accessible. A private link cannot be evaluated. You must also complete the rationale field below explaining your thinking.

Section 4 — Evaluation Rubric

> Rubric criteria are specific to this scenario. Score each criterion: 1 = Weak, 2 = Competent, 3 = Strong. Maximum score per prompt: 9. Overall maximum: 27.

Prompt 1 Rubric — Market Discovery

What this tests: Whether the candidate can design a structured discovery process and move from vague curiosity to validated insight. Strong candidates will look inside the organisation before going outside.

Criterion	Weak (1)	Competent (2)
Research Method Selection	Lists generic methods such as surveys or interviews with no rationale for why they suit a startup audience or Nexus Bank's specific context.	Identifies two or more appropriate methods such as jobs-to-be-done interviews or competitor account reviews and briefly explains why they are appropriate here.
Stakeholder and Source Targeting	Refers only to customers or founders without specifying which stage of startup, sector, or need. Does not mention internal sources.	Identifies a range of startup types or stages and mentions at least one non-obvious source such as accelerators, incubators, or the bank's inbound enquiry log.
Insight Validation and Prioritisation	Assumes hearing a need once from a few people is sufficient to act on, or offers no method for filtering or ranking what they discover.	Mentions triangulating findings across sources or using a framework to prioritise needs by frequency and severity.

Prompt 2 Rubric — Competitive Landscape

What this tests: Whether the candidate can translate competitive intelligence into product positioning decisions, not just produce a feature list comparison.

Criterion	Weak (1)	Competent (2)
Competitive Analysis Depth	Describes competitors vaguely or relies on surface-level features without referencing what startups value about those features.	Identifies specific features offered by Starling or Tide — such as fast onboarding, API access, or no monthly fees — and maps them to startup needs.
Nexus Bank Differentiation Logic	Claims Nexus Bank can win on brand or trust alone without linking those advantages to specific startup pain points or unmet needs.	Identifies one genuine Nexus Bank advantage — such as established credit lines or regulatory credibility — and connects it to a startup need.
Strategic Application	Treats competitive analysis as a standalone exercise and does not connect findings back to what the product should actually do differently.	Uses the competitive analysis to suggest two or three positioning choices for the Nexus Bank account.

Prompt 3 Rubric — Product Strategy Definition

What this tests: Whether the candidate can translate discovery and competitive thinking into a clear, defensible product strategy that acknowledges real-world constraints.

Criterion	Weak (1)	Competent (2)
Feature Prioritisation Rationale	Lists features without explaining why they were chosen, or selects features disconnected from validated startup needs.	Selects two or three features with a brief justification referencing either market research findings or competitive gaps.
Constraint Navigation	Ignores the compliance and commercial tension, or dismisses it as a process issue without engaging with the real trade-off.	Acknowledges the tension and suggests a plausible approach — such as tiered onboarding — that attempts to balance startup expectations with Nexus Bank's requirements.
Success Metrics Definition	Defines success in vague terms such as growth, satisfaction, or happy customers with no targets, timeframes, or measurement approach.	Names two or three specific metrics — such as accounts opened, 90-day retention, or NPS — with a six-month horizon.

Section 5 — Example Responses

> Use these to calibrate AI evaluation scoring and to test your evaluation prompt before candidates use the simulation. Run each example through Claude with the rubric and confirm scores align with the expected levels below.

Prompt 1 — Market Discovery

Strong Response (expected score: 8 to 9 out of 9)

My first move would be to not design anything. Before touching a feature list, I'd want to spend two weeks in discovery — and I'd start with the data we already have. Nexus Bank received over 1,400 enquiries after that campaign. That's a goldmine. I'd ask the customer service team to categorise those enquiries by the type of question asked: is it about fees? About speed of setup? About specific integrations? That segmentation alone would give me early signal on what is actually driving the interest.

Alongside that, I'd recruit 15 to 20 startup founders for jobs-to-be-done interviews — not to ask what features they want, but to understand what problems they are actually trying to solve. I'd deliberately target a mix: pre-revenue founders, companies that have just raised a seed round, and a few who tried to open a Nexus Bank account and gave up. That last group is the most valuable.

I'd also speak to three or four accelerator programme managers — Seedcamp, Techstars UK, and the like. They have a portfolio view of what their cohorts consistently struggle with when banking, which is a different kind of signal to an individual founder's experience.

Once I have raw insight, I'd synthesise using an affinity map and then score themes by frequency and severity. Something that nine founders mention as a weekly problem beats something three mentioned once. I'd turn the top five themes into how might we statements and bring those to the squad as the starting point for feature ideation — not a requirements doc, because we haven't earned that certainty yet.

Weak Response (expected score: 2 to 3 out of 9)

To understand market needs, I would conduct customer research using surveys and focus groups. I would ask current Nexus Bank customers what features they find most useful and then see if those features would also be useful to startups. I would also look at industry reports and market analysis documents to understand what startups are looking for.

I would also hold a workshop with the internal team to understand what they think customers want. Then I would create a list of features based on the research and rank them by how many customers asked for them. This would help us understand the market and prioritise the most important features.

Once I had the research completed, I would present the findings to the leadership team and we would make a decision on which features to build. The key is to make sure we talk to as many people as possible before starting development so that we build the right product.

Prompt 2 — Competitive Landscape

Strong Response (expected score: 8 to 9 out of 9)

Starling and Tide have moved fast, and I'd be fooling myself to say we can beat them on their own terms. Starling's startup account is well reviewed for its clean onboarding — you can open an account in about 10 minutes — and its integration with accounting tools like FreeAgent. Tide is strong on microbusiness and sole trader accounts with no monthly fee, and it has built a good reputation with very early-stage founders who need something simple and cheap.

But there are visible gaps. Neither can offer what a startup needs at Series A or beyond — credit facilities, structured lending, access to FX, or a banking relationship that a VC or grant committee will take seriously. There is also a trust gap: founders raising institutional money or applying for Innovate UK grants often find that their fintech account raises eyebrows. That is Nexus Bank's territory.

My positioning recommendation would be to target the graduation moment — startups that have passed ideation and are now raising, hiring, and dealing with enterprise clients. We would not try to win the sole trader who wants a free account. We would position Nexus Bank as the bank that scales with you: serious enough for investors, flexible enough for a startup, and credible enough when the stakes get real.

Weak Response (expected score: 2 to 3 out of 9)

The main competitors in this space are Starling Bank and Tide. They are both digital-first banks that offer business accounts with low fees. Starling has a good app and Tide is popular with freelancers. They both offer mobile banking and integrations with other tools.

Nexus Bank can compete with these companies by offering similar features but with the added benefit of being a trusted high street bank. Startups might prefer Nexus Bank because of its reputation and because it has physical branches. We could also offer better customer service than the challenger banks.

I think the gap in the market is customer service and physical banking support. If Nexus Bank can offer these things alongside the digital features of the challenger banks, we can win the startup market.

Prompt 3 — Product Strategy Definition

Strong Response (expected score: 8 to 9 out of 9)

For the first release, I would prioritise three features: a fast digital onboarding flow targeting account open in under 72 hours, a business account with built-in Xero and QuickBooks integration, and access to a dedicated startup relationship manager for accounts crossing a certain transaction threshold. These three because they directly address the top-ranked discovery themes, they are competitively differentiated versus fintechs' self-serve-only model, and they are technically feasible within Nexus Bank's existing infrastructure.

On the compliance tension: I would not try to remove KYC requirements, because that is both illegal and the wrong argument to make. Instead, I would propose a risk-tiered onboarding model. Tier one covers lower-risk applicants — UK-registered companies under two years old, founder-led, no complex ownership structure — who go through a streamlined digital-first journey. Tier two triggers additional review for more complex ownership structures. I would need to work through this design with the compliance lead, and I would make it clear that compliance is a co-designer, not a gatekeeper. That framing matters internally.

Success at six months looks like this: 2,000 accounts opened, 70% 90-day retention meaning the account is actively used not just open, and an NPS above 40 from startup customers. I would also track one strategic metric: number of account holders who secure external funding within six months of opening — because that is the signal that we are banking the right companies, not just signing up anyone who applies.

Weak Response (expected score: 2 to 3 out of 9)

For the first release, I would prioritise features like a mobile app, online banking, and good customer support. Startups need these things to manage their money effectively. I would also add integrations with popular tools and make the account easy to open.

The compliance issue is important and we would need to work with the relevant teams to make sure we meet all regulations. This might slow things down but it is necessary.

Success would mean more startups opening accounts and being happy with the service. I would measure this through customer satisfaction surveys and by tracking the number of new accounts opened each month.

Section 6 — Results Output Spec

Simulation Title (shown to candidates on results page)

Nexus Bank Startup Account: Product Strategy Simulation

Assessment Context Description

A realistic product management scenario set inside a major UK bank, testing your ability to discover market needs, analyse competition, and define a product strategy for a new financial product.

Certifier Credential Title

Career Bridge Verified: Product Strategy — Financial Services

Verdict Labels by Score Range

Score Range	Verdict Label	Meaning shown to candidate
85 to 100%	Distinction	Exceptional thinking. You demonstrate the strategic clarity and commercial rigour expected of a strong PM hire. Credential issued with distinction.
70 to 84%	Pass with Merit	Solid, well-reasoned work. You show genuine product instinct and can handle real complexity. Credential issued.
55 to 69%	Pass	You understand the fundamentals and can structure your thinking. A few areas to develop before interviews. Credential issued.
40 to 54%	Borderline	Some good ideas but gaps in analysis or strategic depth. Review the feedback carefully. No credential at this level.
Below 40%	Did Not Pass	The response needs significant development before you are ready for PM interviews. Targeted feedback provided. You may retry in 7 days.

Section 7 — Developer Implementation Guide

> Read this section completely before writing any code. This is your technical specification for the evaluation engine, API integration, and results delivery.

7.1 Step by Step Build Sequence

Follow this sequence exactly. Do not skip steps or build out of order.

Step 1 — Supabase setup (Day 1)
Create the database schema defined in section 7.5. Confirm connection to Next.js project. Test that you can read and write to both tables before moving on.

Step 2 — Simulation landing page (Day 1 to 2)
Build the page the candidate lands on. Video player at top. Written scenario brief below. Start Simulation button. No auth required for MVP. Candidate enters name and email before starting.

Step 3 — Prompt screens (Day 2 to 3)
Build the step by step prompt flow. One prompt per screen. Correct input type per prompt as specified in Section 3. Progress indicator. Do not allow back navigation once a prompt is submitted.

Step 4 — Submission handling (Day 3)
Wire up form submission to store responses in Supabase attempts table. Handle all three submission types: typed text, file upload, and URL with rationale. File text extraction runs server side before storage.

Step 5 — Claude API evaluation (Day 3 to 4)
Build the evaluation endpoint. One API call per prompt. Use the prompt template in section 7.2. Parse and validate JSON response. Store evaluation result in Supabase. Handle errors gracefully as defined in section 7.4.

Step 6 — Results page (Day 4 to 5)
Build the results page consuming the JSON structure in section 7.3. Render correct results video based on verdict. Generate shareable URL token. Trigger Certifier API.

Step 7 — Coach dashboard (Day 5 to 6)
Simple password protected page. Table showing all attempts. Columns defined in section 7.6.

Step 8 — End to end test (Day 6 to 7)
Run three complete simulations through the full flow. One with typed responses only. One with a file upload. One with a URL submission. Confirm evaluation scores are reasonable. Confirm Certifier credential is issued. Confirm shareable URL works.

7.2 Claude API Evaluation Prompt Template

Make one API call per prompt. Never batch all three prompts into one call.

System prompt — use this exact text for every evaluation call:

```
You are an expert product management evaluator. You will assess a candidat
e's written response against a rubric with exactly three criteria. For each
criterion, assign a score of 1 (Weak), 2 (Competent), or 3 (Strong) based o
n the descriptors provided. Return ONLY a valid JSON object. Do not include
any text outside the JSON. Do not use markdown code fences.
```

User message structure — populate dynamically from Supabase:

```
SCENARIO CONTEXT: [insert full scenario brief from Supabase simulations tab
le] CANDIDATE ROLE: Associate Product Manager PROMPT BEING EVALUATED: [inse
rt the specific prompt text] EVALUATION RUBRIC: Criterion 1 — [Name] Weak:
[descriptor] Competent: [descriptor] Strong: [descriptor] Criterion 2 — [Na
me] Weak: [descriptor] Competent: [descriptor] Strong: [descriptor] Criteri
on 3 — [Name] Weak: [descriptor] Competent: [descriptor] Strong: [descripto
r] IMPORTANT EVALUATION INSTRUCTIONS: - Evaluate only against the rubric pr
ovided - Be specific about what the candidate actually wrote, not what they
could have written - Do not reward length over quality - A short precise re
sponse that hits all criteria scores higher than a long generic one that hi
ts none - Reference specific content from their response in feedback fields
- Never use generic phrases like great job or unfortunately - Feedback leng
th per criterion: 40 to 80 words CANDIDATE RESPONSE: [insert candidate's ra
w response text]
```

Feedback tone instruction — append to every user message:

```
Write all feedback as a senior PM mentor speaking directly to a junior coll
eague after reviewing their work. Be honest, specific, and constructive. Th
e tone should feel like a career-accelerating conversation, not a school re
port. Address the candidate as you throughout.
```

7.3 Expected JSON Output Structure

The Claude API must return this exact JSON shape for each prompt evaluation. Build your results page to consume this structure.

```
{ "prompt_number": 1, "criteria": [ { "criterion_name": "Research Method Se
lection", "score": 3, "score_label": "Strong", "feedback": "You clearly exp
lained why you selected founder interviews and internal enquiry data, and l
inked both to the specific Nexus Bank scenario. The decision to target foun
ders who previously abandoned applications showed genuine discovery instinc
t." }, { "criterion_name": "Stakeholder and Source Targeting", "score": 2,
"score_label": "Competent", "feedback": "Good range of sources identified.
To reach Strong, be more specific about targeting founders who previously a
bandoned the Nexus Bank application — that group carries the most concentra
ted signal about where the current experience breaks down." }, { "criterion
_name": "Insight Validation and Prioritisation", "score": 2, "score_label":
"Competent", "feedback": "You mentioned triangulation but did not describe
a structured synthesis method or prioritisation framework. A frequency-seve
rity matrix or affinity mapping step would have demonstrated that you know
how to move from raw insight to actionable finding." } ], "prompt_score":
7, "prompt_max": 9, "prompt_percentage": 78, "prompt_verdict": "Pass with M
erit" }
```

Overall simulation result structure — built after all three prompts are evaluated:

```
{ "candidate_name": "", "candidate_email": "", "simulation_title": "Nexus B
ank Startup Account: Product Strategy Simulation", "discipline": "Product M
anagement", "completed_date": "", "prompt_results": [], "overall_score": 2
1, "overall_max": 27, "overall_percentage": 78, "verdict": "Pass with Meri
t", "verdict_description": "Solid, well-reasoned work. You show genuine pro
duct instinct and can handle real complexity. Credential issued.", "overall
_summary": "3 to 4 sentences summarising performance across all three promp
ts. Reference specific strengths and the single most important development
area.", "top_strength": "The single most impressive thing demonstrated acro
ss the full simulation", "top_development_area": "The single most important
thing to work on before interviews", "shareable_url_token": "", "results_vi
deo_file": "results-merit.mp4", "certifier_trigger": true, "certifier_crede
ntial_id": "" }
```

Calculating overall score:
Sum all prompt scores. Divide by 27. Multiply by 100 for percentage. Apply verdict label from Section 6 table.

7.4 API Configuration

Setting	Value
Model	claude-sonnet-4-20250514
Max tokens	1000
Temperature	0
Calls per simulation	3 — one per prompt, never batched
Retry on invalid JSON	Once with same payload
Timeout	30 seconds per call

Error handling rules — follow these exactly:

If the API call fails or returns invalid JSON after one retry, do not show an error to the candidate. Store their responses safely in Supabase and show this message:

"Your response has been saved. We are processing your results and will notify you by email within 24 hours."

Log the full error server side including the candidate attempt ID so it can be manually reviewed.

Never surface raw API error messages to candidates under any circumstances.

7.5 Supabase Database Schema

Create these two tables exactly as specified.

simulations table

```
create table simulations ( id uuid default gen_random_uuid() primary key, t
itle text not null, discipline text not null, company_name text not null, s
cenario_brief text not null, prompts jsonb not null, rubric jsonb not null,
video_urls jsonb, passing_score integer default 55, created_at timestamp wi
th time zone default now() );
```

attempts table

```
create table attempts ( id uuid default gen_random_uuid() primary key, simu
lation_id uuid references simulations(id), candidate_name text not null, ca
ndidate_email text not null, responses jsonb not null, evaluation_result js
onb, overall_score integer, overall_percentage integer, verdict text, share
able_token text unique, certifier_credential_id text, coach_id uuid, status
text default 'in_progress', completed_at timestamp with time zone, created_
at timestamp with time zone default now() );
```

Indexes to create:

```
create index on attempts(shareable_token); create index on attempts(candida
te_email); create index on attempts(simulation_id);
```

7.6 Submission Type Handling

Typed responses (Prompt 1)
- Capture text from textarea input
- Validate minimum 50 words before allowing submission
- Pass raw text directly to Claude evaluation prompt
- Store raw text in responses JSONB field

File upload (Prompts 2 and 3 upload option)
- Accept PDF and Word (.docx) only
- Maximum file size 10MB
- Store file in Supabase Storage under /simulation-uploads/[attempt_id]/
- Extract text server side before evaluation:
- PDF: use pdf-parse library
- Word: use mammoth library
- Pass extracted text to Claude evaluation prompt
- Store both file storage URL and extracted text in responses JSONB field

URL submission (Prompt 3 URL option)
- Validate input is a correctly formatted URL
- Require typed rationale field to be completed (minimum 50 words)
- Attempt to fetch page content server side using fetch()
- If fetch succeeds: combine fetched content with typed rationale and pass both to Claude evaluation
- If fetch fails (private link, auth required, or timeout): pass typed rationale only to Claude evaluation and set a flag in the attempt record for coach review
- Store URL, fetch success status, and typed rationale in responses JSONB field
- On coach dashboard: show URL as a clickable link and flag any attempts where fetch failed

---

7.7 Coach Dashboard Specification

Build a simple password protected page at /admin/dashboard.

Columns to display in the attempts table:

Column	Data source
Candidate name	attempts.candidate_name
Email	attempts.candidate_email
Simulation	simulations.title
Completed	attempts.completed_at
Score	attempts.overall_percentage %
Verdict	attempts.verdict
Credential	Link if attempts.certifier_credential_id exists
Portfolio	Link to /results/[shareable_token]
Review needed	Flag if URL fetch failed

Additional requirements:
- Sort by completed_at descending by default
- Export to CSV button
- Simple password protection for MVP — no full auth system needed yet
- Clicking a row expands to show full evaluation breakdown per prompt

---

7.8 Certifier API Integration

Trigger the Certifier API immediately after evaluation completes and verdict is Pass or above (55% or higher).

Trigger condition: overall_percentage >= 55

API call:

```
const response = await fetch('https://api.certifier.io/v1/credentials', { m
ethod: 'POST', headers: { 'Authorization': `Bearer${process.env.CERTIFIER_A
PI_KEY}`, 'Content-Type': 'application/json' }, body: JSON.stringify({ reci
pient: { name: attempt.candidate_name, email: attempt.candidate_email }, cr
edential: { name: 'Career Bridge Verified: Product Strategy — Financial Ser
vices', description: `Awarded for completing the Nexus Bank Product Strateg
y Simulation with a score of${attempt.overall_percentage}% (${attempt.verdi
ct})`, issued_on: new Date().toISOString() } }) });
```

Store the returned credential ID in attempts.certifier_credential_id.

If Certifier API fails, log the error and retry once after 60 seconds. If it fails again, flag for manual issuance. Do not block the results page on Certifier success.

7.9 Shareable Portfolio URL

Generate a unique token for each completed attempt and build a public results page.

```
// Generate token on completion const token = crypto.randomUUID(); await su
pabase .from('attempts') .update({ shareable_token: token }) .eq('id', atte
mpt.id); // Public results page route // /results/[token]
```

The public results page at /results/[token] should show:
- Career Bridge Foundation header with Sheffield Hallam University association noted
- Candidate name and simulation title
- Fictional company and discipline
- Date completed
- Overall score percentage and verdict
- Per prompt scores and written feedback
- Overall summary and top development area
- Certifier credential link if issued
- Career Bridge branding throughout

This page must be publicly accessible without login.

Section 8 — Video and Voice Specification

8.1 Scenario Introduction Video

Presenter persona: Sarah Chen, Head of Product, Nexus Bank
Video length: 60 to 90 seconds
Tool: HeyGen (existing account and avatars)
Placement: Above the written scenario brief on the simulation landing page
Autoplay: No — candidate clicks play
Required to proceed: No — candidate can skip and read the written brief
File format: MP4, 1080p, max 50MB
Storage: Supabase Storage or Cloudflare CDN
Player: Plyr.io (lightweight, clean, no YouTube branding)

Script for Sarah Chen:

Hi, I'm Sarah Chen, Head of Product here at Nexus Bank.

Thanks for joining us for this simulation. I want to give you some context before you get started.

We’ve just come off the back of a really successful Christmas campaign that positioned Nexus Bank as the bank for ambitious startups. And it worked — perhaps better than we expected. Our enquiries from startup founders have gone through the roof.

The CEO has asked us to move fast on this. We have a genuine opportunity to build something startups actually want, but right now we don’t have a clear product strategy and we don’t fully understand the market.

That’s where you come in.

Your job over the next hour or so is to show us how you think. How you’d approach defining a product strategy, how you’d understand the market, and how you’d make sense of what we know and don’t know.

There are no trick questions here. We want to see your thinking, your instincts, and how you approach ambiguity.

Good luck. I’m looking forward to seeing what you come up with.

8.2 Results Page Videos

Create four short pre-recorded videos, one per verdict band. Serve the correct video based on the verdict field in the evaluation JSON.

File naming convention — use these exact names:

Verdict	File name
Distinction	results-distinction.mp4
Pass with Merit	results-merit.mp4
Pass	results-pass.mp4
Borderline or Did Not Pass	results-development.mp4

Placement: Top of results page, autoplays with sound off by default. Candidate can unmute and replay.

Developer instruction: Read the results_video_file field from the overall evaluation JSON and serve the corresponding file.

Script — Distinction

Hi, it's Sarah again. I've just reviewed your simulation and I want to say — this is exceptional work. You demonstrated exactly the kind of strategic thinking we look for in a PM. Discovery before solutions, commercial awareness, and genuine clarity about what matters and what doesn't. You should feel very confident taking this portfolio output into interviews. This is a strong result.

Script — Pass with Merit

Hi, it's Sarah. Thank you for completing the simulation. You've shown some really solid thinking here and there are moments where your instincts are genuinely impressive. The feedback on your results page will show you exactly where to push further. You're clearly developing well. Keep going.

Script — Pass

Hi, it's Sarah. I appreciate you completing this simulation. You've demonstrated a real understanding of the fundamentals and that's a good foundation to build on. The detailed feedback below will show you specifically what to focus on next. Take it seriously and you'll develop quickly.

Script — Borderline or Did Not Pass

Hi, it's Sarah. Thank you for giving this a go. Product management is a discipline that takes time to develop and this simulation is designed to show you exactly where to focus your learning. Please read the detailed feedback carefully. It gives you a clear picture of what to work on. We'd encourage you to revisit some core PM frameworks and come back when you're ready. We'll be here.

8.3 Video Inventory Task

Before developers integrate any videos, the founder must complete a video inventory
